

FINALLY, LET'S CREATE A QUICK SUMMARY FOR THE CLIENT

Now that you've analyzed the data and collected the insights, the client wants a quick update on the project progress. Communicating your findings effectively is a critical component of any data science project. To do this, draft an abstract (executive summary) of your findings so far.

Here is your task:

Develop an abstract slide synthesizing all the findings from the project, keeping in mind that this will be for the key stakeholders meeting which the Head of the SME division (as well as other various stakeholders) will be attending.

Note: a steering committee meeting is a meeting where the BCG team presents key findings and recommendations (and/or project progress) to key client stakeholders.

Please use the template below and submit your summary slide in PDF format.

A few things to think about for this abstract include:

- What is the most important number or metric to share with the client?
- What are the next steps the client should take following your analysis?
- What business impact? How would the model affect the client's bottom line?

Please note, there are multiple ways to approach the task and that the sample answer is just one way to do it.

If you are stuck:

- What do you think the client wants to hear? How much detail should you go into, especially with the technical details of your work?
- Always test what you write with the "so what?" test, i.e. sharing a fact, even an interesting one, only matters if the client can actually

do something useful with it. For example, noting that "60% of customers are from City A" is pointless, but "customers in City A should be prioritized for giving discounts as they are among your most valuable ones," if true, is an actionable finding.
